

SMART Care Control®

Care – intelligent and individual

.bock^{///}

Sensor-supported monitoring system

SMART Care Control combines individual sensor-supported resident monitoring with wireless notifications and specifically programmable bed functions. SMART Care Control's intelligent monitoring functions give residents, and their families, peace of mind, because care givers are informed of problems immediately.

- // Bed exit monitor with edge sensitivity
- // Recording of time spent out of bed
- // Recognition of micro and macro movements
- // Modularly expandable sensor functions

The bed exit sensor mat registers both the resident's presence and movement profile in the bed.

Intelligent bed control

The programmable bed controls can specifically save each resident's preferred bed positions – and when necessary for therapeutic reasons, can be used to define limits to the bed settings the resident can choose using the hand control.

SMART Care Control uses established wireless technology for secure data transfers. That allows the technical functions of nursing care beds equipped with SMART Care Control to be checked remotely, saving you time and protecting your investment.

The SMART Care Control apps

SMART Care Control combines data from the bed's integrated sensors and technology, and presents it via a graphic display. That gives you a unique and valuable overview of the well-being of your residents – without unnecessary checks – letting you concentrate on the most important tasks!

SMART Care Control automatically saves all data and makes it available for documentation. In case of subsequent queries, SMART Care Control gives you the security of comprehensive documented evidence.

The SMART Care Control Navigator app allows you to control the nursing care bed's technical functions.

The SMART Care Control Monitor app gives you a mobile overview of the data and notifications generated by the sensors at all times.

- // Intuitive operation from a smartphone or tablet
- // Wireless notification and monitoring functions
- // Individually adapted to each bed
- // Documentation of all data

SMART Care Control can be individually configured for each resident:

- Define notification functions
- Programme preferred bed positions
- Document movement patterns in bed

Maintain an overview of the entire residential unit at all times

The innovative app offers a rapid overview of relevant data about all beds in your residential unit – wherever you are in the building.

Time savings thanks to valuable information
Among other things, the graphic presentation of data shows you the resident's movement profile in bed – an important basis for decisions regarding the prevention of bedsores.

Qualified notifications for situation-specific care

SMART Care Control helps you maintain an overview: The app tells you which residents currently need your help – and which residents are managing independently. That allows care givers to react appropriately to specific situations, saving time and energy.

SMART Care Control offers three different types of notification, which can be individually configured for each resident.

- Simple notification, as a status report in the app
- Silent alarm, as a smartphone message
- Direct staff alert via the in-house call system

- // Rapid overview of all beds in the residential unit via a tablet and smartphone app
- // Situation-specific notification functions
- // More freedom and safety for residents
- // Lighter workload for care givers

practico alu SCC – the first nursing care bed that comes with future-proof SMART Care Control technology.

The intelligent nursing care bed

The practico alu SCC fulfils all the requirements for a modern, carefully designed nursing care bed – and offers added intelligence. It comes equipped with SMART Care Control Technology.

The practico alu SCC is upgradeable:

Additional sensors can be added to the system in the future, allowing its intelligent functions to be continuously expanded.

- // Equipped with SMART Care Control
- // Individually programmable bed functions
- // Height adjustment from 25 to 80 cm
- // Ergonomic backrest to support a physiological sitting position
- // Tool-free extension to 220 cm, including extension of the side rails
